

# HTML Overview

The contents and slides of this topic are used with permission from:

- Jennifer Robbins, Learning Web Design (Chapter 4), O'Reilly, 5th edition, May 2018, ISBN 978-1-491-96020-2.

1

## Overview

- ▶ **How markup works: Elements and attributes**
- ▶ **Minimal HTML document structure**
- ▶ **Identifying text elements: Block and inline**
- ▶ **Troubleshooting and validating HTML**

2

## Content Without Markup

Without HTML markup to describe content structure, text runs together; line breaks are ignored:

```
Black Goose Bistro
```

```
The Restaurant
```

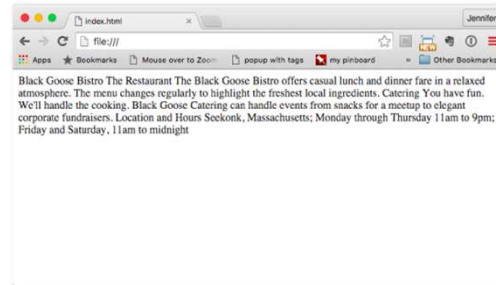

```
The Black Goose Bistro offers casual lunch
and dinner fare in a relaxed atmosphere. The
menu changes regularly to highlight the
freshest local ingredients.
```

```
Catering
```

```
You have fun. We'll handle the cooking. Black
Goose Catering can handle events from snacks
for a meetup to elegant corporate
fundraisers.
```

```
Location and Hours
```

```
Seekonk, Massachusetts;
Monday through Thursday 11am to 9pm; Friday
and Saturday, 11am to midnight
```

3

## What Browsers Ignore

- ▶ Multiple character spaces (white space)
- ▶ Line breaks (carriage returns)
- ▶ Tabs
- ▶ Unrecognized markup

4

## Markup Basics

Text must be marked up meaningfully and accurately (**semantically**) with HTML tags:

- ▶ Browsers need markup to display content correctly.
- ▶ Markup makes content elements available to scripts and style rules.
- ▶ Markup aids search engines.

5

## Anatomy of an HTML Element

### tag

The element name in angle brackets

### element

The content and its markup (start and end tags)

Example: `<h1>Black Goose Bistro</h1>`

6

## Some Elements Are Empty

Some elements have no content and provide a simple directive. They are called **empty elements**:

```
<element-name>
```

Example: The `br` element inserts a line break.

```
<p>1005 Gravenstein Highway North<br>Sebastopol, CA 95472</p>
```

7

## Attributes

**Attributes** are instructions that clarify or modify an element. They appear in the opening tag after the element name:

```
<element attribute="value">Content</element>
```

```
<a href="http://oreilly.com">O'Reilly site</a>
```

8

## Attributes (cont'd)

There can be more than one attribute in a tag:

They are separated by spaces and can go in any order.

9

## Attributes (cont'd)

- ▶ Most attributes take values, which follow an = sign; some are single descriptive words.
- ▶ A value might be a number, word, string of text, URL, or measurement.
- ▶ Quotation marks aren't strictly required but are recommended for consistency.
- ▶ Single or double quotation marks are okay.
- ▶ Attribute names and values are defined in the HTML specification.
- ▶ Some attributes are required.

10

## Nesting Elements

Putting elements inside other elements is called **nesting**. Make sure closing tags don't overlap:

```
<div>
  <h1>Headline</h1>
  <p>This is <em>emphasized</em> text.</p>
</div>
```

11

## HTML Comments

To leave a note in an HTML document, mark it up as a **comment**:

```
<!-- start global navigation -->
<ul>
...
</ul>
<!-- end global navigation
and begin the main header
for content page -->
```

Text between `<!--` and `-->` won't display in the browser. Keep in mind that they are still visible in the source.

12

## Minimal Document Structure

It is recommended that HTML documents have the following minimal structure:

```
<!DOCTYPE html>
<html>
  <head>
    <meta charset="utf-8">
    <title>Title here</title>
  </head>
  <body>
    <!-- Page content goes here.-->
  </body>
</html>
```

13

## Minimal Document Structure (cont'd)

The **DOCTYPE** declaration lets browsers know that the document is written according to the HTML5 specification:

```
<!DOCTYPE html>
<html>
  <head>
    <meta charset="utf-8">
    <title>Title here</title>
  </head>
  <body>
    [Page content goes here.]
  </body>
</html>
```

14

## Minimal Document Structure (cont'd)

The `html` element is the **root element** that contains all the elements in the document:

```
<!DOCTYPE html>
<html>
  <head>
    <meta charset="utf-8">
    <title>Title here</title>
  </head>
  <body>
    [Page content goes here.]
  </body>
</html>
```

15

## Minimal Document Structure (cont'd)

The `head` element contains elements that pertain to the document and are not rendered as content, such as **title**, **metadata**, **style sheets**, and **scripts**:

```
<!DOCTYPE html>
<html>
  <head>
    <meta charset="utf-8">
    <title>Title here</title>
  </head>
  <body>
    [Page content goes here.]
  </body>
</html>
```

16

## Minimal Document Structure (cont'd)

**meta** elements provide document **metadata**. In this case, it says that the document uses an expanded **character set** (UTF-8). It could also provide keywords, author information, publishing status, and more:

```
<!DOCTYPE html>
<html>
  <head>
    <meta charset="utf-8">
    <title>Title here</title>
  </head>
  <body>
    [Page content goes here.]
  </body>
</html>
```

17

## Minimal Document Structure (cont'd)

The **title** element is required. Titles display in the browser tab and bookmark lists, and are used by search engines:

```
<!DOCTYPE html>
<html>
  <head>
    <meta charset="utf-8">
    <title>Title here</title>
  </head>
  <body>
    [Page content goes here.]
  </body>
</html>
```

18

## Minimal Document Structure (cont'd.)

The **body** element contains the content of the document. The content is everything you want to show up in the browser window:

```
<!DOCTYPE html>
<html>
  <head>
    <meta charset="utf-8">
    <title>Title here</title>
  </head>
  <body>
    [Page content goes here.]
  </body>
</html>
```

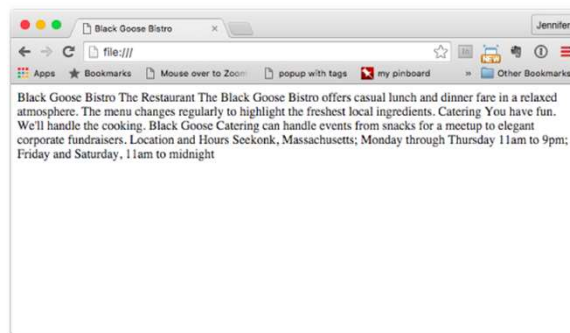

19

## A Structured Document

With the document structure in place, there is a title in the browser tab, but the content is still unstructured.

```
<!DOCTYPE html>
<html>
<head>
  <meta charset="utf-8">
  <title>Black Goose Bistro</title>
</head>
<body>
Black Goose Bistro

The Restaurant
The Black Goose Bistro offers casual
lunch and dinner fare in a relaxed
atmosphere. The menu changes regularly
to highlight the freshest local
ingredients.
...
Location and Hours
Seekonk, Massachusetts;
Monday through Thursday 11am to 9pm;
Friday and Saturday, 11am to midnight
</body>
</html>
```

20

## Marking Up Content

- ▶ The purpose of HTML is to add meaning and structure to the content. This is called **semantic markup**.
- ▶ It is **not** intended to describe how the content should look (its presentation).
- ▶ The way elements relate to one another forms an outline-like structure called the **DOM (Document Object Model)**.
- ▶ The DOM is the foundation on which you apply styles and scripts.

21

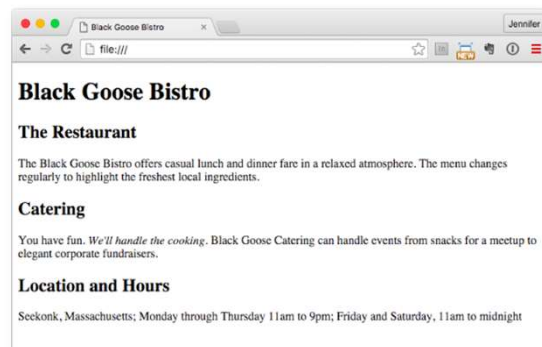

## Basic Text Elements

With headings (`<h1>`) and paragraphs (`<p>`) identified, the browser can display the content appropriately:

```
...
<body>
<h1>Black Goose Bistro</h1>

<h2>The Restaurant</h2>
<p>The Black Goose Bistro
offers casual lunch and
dinner fare in a relaxed
atmosphere. The menu changes
regularly to highlight the
freshest local
ingredients.</p>

<!--more content-->
</body>
```

22

## Block and Inline Elements

### Block elements

Major components of the page that display like rectangular blocks stacking up on the page

Example: headings, paragraphs, long quotations

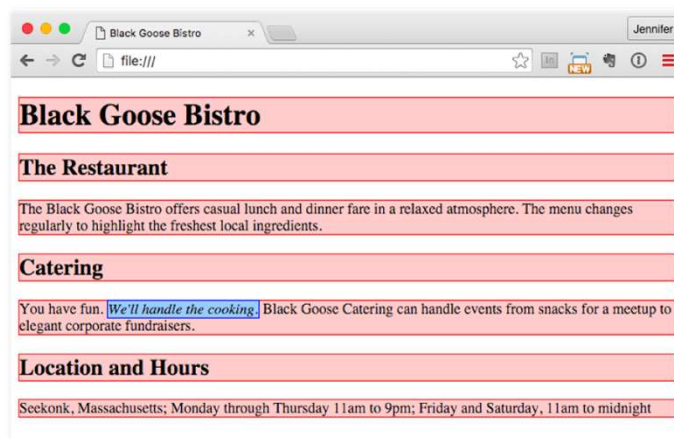

### Inline elements

Appear within the text flow of a block element

Example: emphasized text, links, abbreviations

23

## Block and Inline Elements (cont'd)

Block elements (headings, paragraphs) outlined in **RED**.

Inline element (emphasized text) outlined in **BLUE**.

24

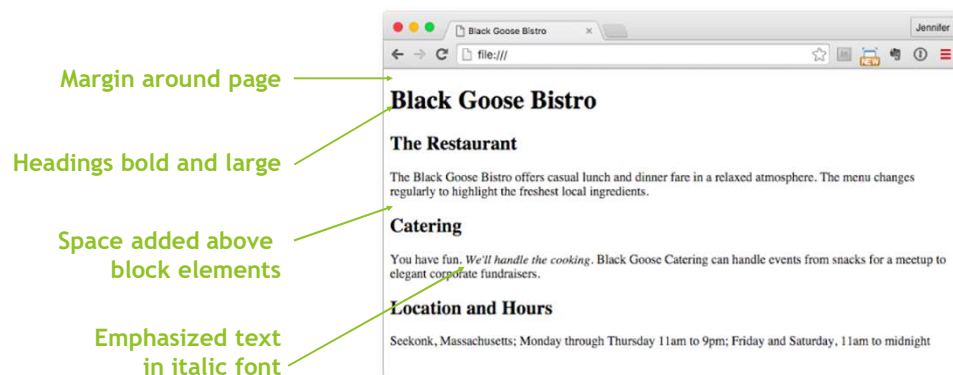

## Style Sheets

- ▶ HTML only describes structure, not presentation
- ▶ Presentation is controlled by style sheets (CSS)
- ▶ Browsers have their own style sheets (user agent style sheets) with default styles for HTML elements
- ▶ You can write your own styles to override the default styles

25

## Style Sheets (cont'd)

The browser parsed the markup and used its built-in style sheet to format the text elements in the example:

26

## Troubleshooting HTML

Small mistakes and missing characters can cause HTML documents to “break.”

### Common mishaps:

- ▶ Missing closing tag (or / in closing tag)
- ▶ Missing closing bracket in a tag
- ▶ Missing quotation mark around an attribute value
- ▶ Not saving your document before viewing changes in the browser

27

## Troubleshooting (cont'd)

When a slash is omitted, the browser doesn't know when the element ends:

```
<h2>Catering</h2>
<p>You have fun. <em>We'll handle the cooking.<em> Black Goose
Catering can handle events from snacks for a meetup to elegant
corporate fundraisers.</p>
```

g. <em>

### Catering

You have fun. We'll handle the cooking. Black Goose Catering can handle events from snacks for a meetup to elegant corporate fundraisers.

### Location and Hours

Seekonk, Massachusetts;  
Monday through Thursday 11am to 9pm;  
Friday and Saturday, 11am to midnight

28

## Troubleshooting (cont'd)

A missing end bracket makes the browser interpret all the following characters as part of the tag:

```
<h2The Restaurant</h2>
<p>The Black Goose Bistro offers casual lunch and dinner fare
in a relaxed atmosphere. The menu changes regularly to highlight
the freshest local ingredients.</p>
```

<h2The

Missing subhead

Without the bracket, all the following characters are interpreted as part of the tag, and "The Restaurant" disappears from the page.

29

## Validating Your Documents

**Validate** a document to make sure that you have abided by the HTML rules and that there are no errors:

- ▶ Include the DOCTYPE declaration
- ▶ Indicate the character encoding
- ▶ Include required attributes
- ▶ Don't use non-standard elements
- ▶ Don't mismatch tags
- ▶ Nest elements correctly (no overlaps)
- ▶ Check for typos and other minor errors

30

## Validating Your Documents

- ▶ Use a validator tool like the one at [html5.validator.nu](http://html5.validator.nu).
- ▶ Upload a document or provide a link, and the validator returns an error report.

Content model for element head:  
If the document is an XHTML document or if the information is available from a higher-level protocol, zero or more elements of metadata content, of which no more than one is a title element and no more than one is a base element.  
Otherwise, one or more elements of metadata content, of which exactly one is a title element and no more than one is a base element.  
A head element's start tag can be omitted if the element is empty, or if the first thing inside the head element is an element.  
A head element's end tag can be omitted if the head element is not immediately followed by a space character or a comment.

There were errors. (Fried in the testkitchen mode)

The Content-Type was text/html. Used the HTML parser.  
Total execution time 2 milliseconds.
